Closing an Income-Shifting Margin: Family Income Reallocation after Dividend Tax Reform

Abstract: I examine how business-owning families respond when tax rules restrict dividend-based income splitting. Canada's 2018 expansion of the Tax on Split Income rules raised the tax rate on dividends received by non-exempt spouses of private-business owners. Using linked personal, payroll, and corporate tax records, I compare exposed families with families likely exempt from the reform and exploit differences in pre-reform splitting incentives and simulated tax penalties. The reform reduces dividends reported by exposed spouses by about 53\% relative to controls, while owners report more dividend and employment income. Family taxable income declines much less than spouse dividends, and log tax liability rises modestly. The main response is a reallocation of income reported within the family. Among exposed families, the elasticity of spouse dividends with respect to the pre-reform splitting incentive is similar across income quartiles. This differs from the conventional elasticity of taxable income but suggests that access to tax-planning channels helps shape measured tax responsiveness. For a given increase in the simulated tax penalty, tax liability rises more in percentage terms among moderate-income families than among those in the highest income quartile. Families facing the largest total penalties show the clearest decline in family taxable income and increase in tax liability.

Working Papers

Should I Stay or Should I Go? The Impact of Taxation on Canadian Inter-Provincial Migration
with Adam M. Lavecchia and Alisa Tazhitdinova
Reject and Resubmit, Journal of Public Economics (July 2026)
